

E-commerce website (Frontend)

MY APPROACH:

I used HTML, CSS, and bootstrap to create the website. I am currently a beginner at CSS and HTML. I learned the CSS from code with Harry YouTube channel.

I decided to create an e-commerce website exclusively for the sale of books.

First, I created the structure of the website using HTML. The home page of the website has a navigation bar with title buttons named Home, shops, login, and contact us. The color scheme and the background images have been added using CSS. Each ID in the HTML code file is linked with the CSS code section for basic formatting of the page.

Then as we scroll down through the webpage, we can see 3 boxes (created using CSS) with buttons. As we click on the button "Explore", we are directed to another webpage with the respective information.

I could not use javascript in the formatting of my website because of lack of time. But I am looking forward to learning it since I like working on the backend rather than the designing part of the website.

The problems that I faced while creating the website are that the margin setup was not proper. Also, the alignment of the different data objects on the web page was very difficult. I had to put the random values to figure out the size and the colour schemes of the website.
